Helium Leak Testing

Oceaneering offers helium leak testing and nitrogen filling of canisters for product qualification and factory acceptance testing of equipment.

FEATURES

- Portable test equipment
- Qualitative and quantitative leak testing
- Certified test personnel
Helium Leak Testing

Oceaneering offers helium leak testing in-house at our facilities in Kristiansand, Norway. Helium leak tests are typically performed on electronic housings used in subsea applications or to complete non-destructive testing of welds. The test is suitable for seals, penetrators, and housings of pressure retaining components. Quantitative techniques are used for electronics canisters and pressure vessels. Qualitative techniques are suited to find the location of leaks for further investigation or repair. Oceaneering can perform both types of testing for any application.

We are also able to fill canisters with nitrogen after successful helium leak testing to ensure internal electronic components are adequately protected.
