Engineered Fiber Matrix (EFM) has been specially designed to be mixed in a low ratio of water to product. Follow the EFM Loading Chart and Application Guide closely. Not mixing enough EFM will water-down the slurry and compromise coverage during application and the performance of the formulation.

Application / Loading Procedures

A. Strictly comply with equipment Manufacturer’s installation instructions and recommendations. Use approved hydro-spraying machines with fan-type nozzle (50-degree tip) whenever possible to achieve best soil coverage. Apply from opposing directions to assure 100% soil surface coverage. Slope interruption devices or water diversion techniques are recommended when slope lengths exceed the maximum recommendations as shown in the Slope Application and Slope Interruption Limits tables on the back page of these guidelines.

B. To ensure proper application rates, measure and stake area. For maximum performance, apply EFM as follows:

1. Apply fertilizer with specified prescriptive agronomic formulations, seed and EFM at a rate of 60 pounds per 100 gallons (27 kg/379 liters) of water over properly prepared surfaces.
2. See loading chart on the back and confirm loading rates with equipment manufacturer. Do not leave seeded surfaces unprotected, especially if precipitation is imminent.

C. Fill 1/3 of mechanically agitated hydroseeder with water. Turn pump on for 15 seconds and purge and pre-wet lines. Turn pump off.

D. Turn agitator on, open recirculation valve and load low density materials first (i.e. seed).

E. Continue slowly filling tank with water while loading fiber matrix into tank.

F. Consult loading chart on the back to determine the number of bags to be added for desired area and application rate.

G. EFM should be completely loaded before water level reaches 75% of the top of tank.

H. Add fertilizer as water level approaches the top of the tank.

I. Top off with water and mix until all fiber is fully broken apart and hydrated (minimum of 10 minutes — increase mixing time when applying in cold conditions). This is very important to fully activate the bonding additives and to obtain proper viscosity.

J. Shut off recirculation valve to minimize potential for air entrainment within the slurry.

K. Slow down agitator and start applying with a 50-degree fan tip nozzle.

L. Spray in opposing directions for maximum soil coverage.

1 Best results and more rapid curing are achieved at temperatures exceeding 60°F (15°C). Curing times may be accelerated in high temperature, low humidity, and windy conditions with product applied on dry soils.

2 Do not add additional tackifiers or polymers to this pre-mixed formulation.

### Additional Notes:

- Rough surfaces (rocky terrain, cat tracks, ripped soils, etc.) may require additional product to achieve 100% coverage.
- Be sure to allow for residual material in tank on subsequent applications.

### Visual Key for Proper Application

![Proper Application Image](image)

**Proper Application**

- [3.4 mm thickness](image)
- [4.0 mm thickness](image)
- [4.6 mm thickness](image)

**Improper Application**

For conversions:
- 1 lb = 0.454 kg
- 1 ac = 0.41 ha
- lb/ac x 1.12 = kg/ha
- 1 kg = 2.20 lb
- 1 ha = 2.47 ac

1EFM not recommended for slopes greater than 1H:1V.

*Listed slope interruption limits are for product applications on a 3H:1V slope. For application on steeper slopes, slope interruption lengths may need to be decreased.
